Software Management Plan

Research Software Management Course

Irene Kikkert - 2026

netherlands eScience center

Description of the software

The purpose of the software is to investigate the research question: *"How is pinguin body mass associated with bill length across all species?"*. However, the intended use is to learn how to run R and Python scripts for this analysis by using Github.

Which version control system will you use to manage your source code?

Github will be used.

How will you make your software publicly available? Please provide links to the software if this is already the case.

This will also be made publicly available using Github. This is available via:
https://github.com/irenedk/my_researcj_project/blob/main/code/00_sample_analysis.ipynb

What licence will your software have?

It has an MIT licence.

What measures will be taken during the project to ensure the long-term sustainability of the software developed in the project? (max. 300 words)

The software will be maintained on an as-needed basis throughout the project and, where feasible, after its completion. Maintenance will primarily focus on resolving reported issues, addressing user requests, and implementing updates necessary to ensure continued usability and compatibility.

What measures will be taken to support the software after completion of the project? (max. 300 words)

After completion of the project, the software will remain publicly available through GitHub, including documentation to support installation and use. Users will be able to report bugs, submit feature requests, and ask questions through GitHub Issues. These requests will be reviewed and addressed on a best-effort basis, depending on their relevance and available resources. No dedicated support infrastructure is planned.

What resources are needed to ensure the long-term usability and availability of the software, and how will these resources be funded or obtained? (max. 300 words)

No dedicated funding or additional infrastructure is required to ensure the long-term availability of the software.

Are there other measures that will be taken to promote the software's longevity? (max. 300 words)

No.

How will your software be documented? Please provide a link to the documentation, if available.

In the Github repository, the README file provides instructions on how to install the correct dependencies and use. Also, the new python notebook will provide clear instructions on how to use and run the cells.

How will your software document its installation requirements? Please provide a link to the installation documentation, if available.

All instructions are listed in the README.

How will you enable citation of your software by users? Please provide a link to software citation data and/or DOI if available.

A CFF is provided, including a DOI that is included in the README.

How will your software be tested? Please provide a link to automated testing results, if available.

It will be checked through the CODECHECK.

How will your software be packaged and distributed? Please provide a link to available packaging information (e.g. entry in a packaging registry, if available).
